

Clim'Ability Care :

For a new corporate culture in the Upper Rhine region that prevents climate risks

www.clim-ability.eu

The **Clim'Ability Care** project continues the intentions of the previous projects Clim'Ability (2016-2019) and Clim'Ability Design (2019-2023): to support SMEs and SMIs in dealing with the consequences of climate change. This support was initially focused on adaptation, which appeared to be the poor relation of climate policies that had been built on the principle of warning and mitigation.

The project aims to expand territories, qualified as pilot territories, to create a new entrepreneurial culture based on a broader approach to climate risks. The project is organized around a roadmap that identifies critical infrastructure that can trigger cascading phenomena and double climate impacts.

Another aim is to update open source tools to support companies in their approach to climate resilience and testing specific solutions that can be adopted on a broader scale are among the responses to these challenges.

Clim'Ability Care wants to meet this challenge by exploiting the synergies between local experimentation, communication and awareness-raising

Team Clim'Ability Care

initiatives and internship proposals. The territories' engagement in the search for levers of change involves experimentation with the aim of disseminating them throughout Europe and beyond.

This mobilization is for the benefit of a new culture of precautionary entrepreneurship for the major ecosystems and the human and non-human populations of the Upper Rhine. To contribute to this, we mobilize all resources, including the methods we have developed, in particular through collaboration with SMEs/SMEs, while respecting the specific maturity levels of each one.

Finally, the project has the task of studying the conditions for the sustainability of these climate services for companies in the Upper Rhine.
